I claim:

5

- 1. A composite on a surface of a substrate, wherein said composite comprises:
 - a) a first coating comprising pigment and binder polymer;
 - b) reflective beads; and
 - c) a clear coating, comprising binder polymer.
- 10 2. The composite of claim 1, wherein said binder polymer has a glass transition temperature of -10°C to 70°C.
 - 3. The composite of claim 1, wherein said clear coating has a percent visible light transmission of 80 to 100% when measured at a coating thickness of 500 microns.
 - 4. The composite of claim 1, wherein said clear coating has a percent visible light transmission of 85 to 100% when measured at a coating thickness of 500 microns.
 - 5. The composite of claim 1, wherein said clear coating has a percent visible light transmission of 90 to 100% when measured at a coating thickness of 500 microns.
- 25 6. The composite of claim 1, wherein said reflective beads are spherical, or approximately spherical glass beads.
- 7. The composite of claim 1, further comprising at least one absorber,
 wherein said absorber is selected from the group consisting of
 organic super absorbent polymers, ion-exchange resins, hollow
 sphere polymers, molecular sieves, talcs, inorganic absorbers,

porous carbonaceous materials, non-porous carbonaceous materials, and mixtures thereof.

8. The composite of claim 1,

wherein:

- a) said surface of said substrate is a road surface; and
- b) said composite is a traffic marking.
- 9. A method for preparing a composite on a surface of a substrate, the method comprising the steps of:
 - applying at least one first coating composition, comprising pigment, binder polymer, and water, to said surface;
 - 2) applying at least one clear coating composition, comprising binder polymer and water, to said surface to which said first coating composition has been applied;
 - 3) applying reflective beads simultaneously, or nearly simultaneously, with at least one of steps 1 or 2; and
 - 4) allowing the compositions to dry.
- 20 10. A method for preparing a composite on a surface of a substrate, the method comprising the steps of:
 - 1) applying at least one first coating composition, comprising pigment, binder polymer, and water, to said surface;
 - 2) applying at least one clear coating composition, comprising binder polymer and water, to said surface to which said first coating composition has been applied;
 - 3) applying reflective beads in at least one step between any two consecutive steps; and
 - 4) allowing the compositions to dry.
 - 11. The method of claim 9 or 10, wherein said binder polymer has a glass transition temperature of -10°C to 70°C.

5

12. The method of claim 9 or 10, wherein said clear coating composition, when dried to form a coating of thickness equal to 500 microns, displays a percent visible light transmission of 80 to 100%.

13. The method of claim 9 or 10, wherein said clear coating composition, when dried to form a coating of thickness equal to 500 microns, displays a percent visible light transmission of 85 to 100%.

10 14. The method of claim 9 or 10, wherein said clear coating composition, when dried to form a coating of thickness equal to 500 microns, displays a percent visible light transmission of 90 to 100%.

15. The method of claim 9 or 10, wherein said reflective beads are spherical, or approximately spherical, glass beads.

16. The method of claim 9 or 10, further comprising the step of applying at least one absorber,

wherein said absorber is selected from the group consisting of organic super absorbent polymers, ion-exchange resins, hollow sphere polymers, molecular sieves, talcs, inorganic absorbers, porous carbonaceous materials, non-porous carbonaceous materials, and mixtures thereof.

25 17. The method of claim 9 or 10,

wherein:

- a) said surface of said substrate is a road surface; and
- b) said composite is a traffic marking.
